A note on Hofmann-Streicher universes

Steve Awodey

April 27, 2022

Let $\mathbb C$ be a small category and $\widehat{\mathbb C}=\mathsf{Set}^{\mathbb C^{\mathrm{op}}}$ the category of presheaves on $\mathbb C.$

1. The Hofmann-Streicher universe

In [HS97] the authors define a (type-theoretic) universe

$$El \to U$$
 (1)

in $\widehat{\mathbb{C}}$ as follows. For $I \in \mathbb{C}$, set

$$U(I) = \operatorname{ob}(\widehat{\mathbb{C}/I}), \tag{2}$$

$$\mathsf{E}l(\langle I, A \rangle) = A(id_I), \tag{3}$$

with an evident associated action on morphisms, which need not concern us for the moment. A few comments are required:

- 1. Since $U: \mathbb{C}^{op} \longrightarrow \mathsf{Set}$, we have taken the underlying $set \ \mathsf{ob}(\widehat{\mathbb{C}/I})$ of objects of the category $\widehat{\mathbb{C}/I}$ in (2).
- 2. In (3), and throughout, the authors steadfastly adopt the "categories with families" point of view in describing the morphism $\mathsf{E} l \to U$ in $\widehat{\mathbb{C}}$ as an object in

$$\widehat{\int_{\mathbb{C}} U} \simeq \widehat{\mathbb{C}}/_{U}, \tag{4}$$

and thus as a presheaf on the category of elements $\int_{\mathbb{C}} U$ (rather than specifying the object $\mathsf{E} l$ in $\widehat{\mathbb{C}}$). Thus the argument $\langle I,A\rangle\in\int_{\mathbb{C}} U$ in (3) consists of an object $I\in\mathbb{C}$ and an element $A\in U(I)$.

3. In order to account for size issues, the authors assume a Grothendieck universe \mathcal{U} in Set, the elements of which are called *small*. The category \mathbb{C} is then assumed to be small, as are the values of the presheaves (unless otherwise stated).

The presheaf U, which is not small, is regarded as the Grothendieck universe \mathcal{U} "lifted" from Set to Set^{\mathbb{C}^{op}}. We will analyse the construction of (1) from a slightly different perspective in order to arrive at its basic property as a classifier for small families in $\widehat{\mathbb{C}}$.

2. An unused adjunction

For a presheaf X on \mathbb{C} , recall that the category of elements is the comma category,

$$\int_{\mathbb{C}} X \ = \ \mathsf{y}_{\mathbb{C}}/_X \ ,$$

where $y_{\mathbb{C}}: \mathbb{C} \to \mathsf{Set}^{\mathbb{C}^{\mathrm{op}}}$ is the Yoneda embedding, which we may supress and write simply $\mathbb{C}/_X$. While the category of elements $\int_{\mathbb{C}} X$ is used in the specification of the Hofmann-Streicher universe $\mathsf{E}l \to U$ at the point (4), the authors seem to have missed a trick, which can be used to simplify things:

Proposition 1. The category of elements functor $\int_{\mathbb{C}} : \widehat{\mathbb{C}} \longrightarrow \mathsf{Cat}$ has a right adjoint, which we denote

$$\nu_{\mathbb{C}}: \mathsf{Cat} \longrightarrow \widehat{\mathbb{C}}$$
.

For a small category \mathbb{A} , we call the presheaf $\nu_{\mathbb{C}}(\mathbb{A})$ the \mathbb{C} -nerve of \mathbb{A} .

Proof. As suggested by the name, the adjunction $\int_{\mathbb{C}} \exists \nu_{\mathbb{C}}$ can be seen as the familiar "realization \exists nerve" construction with respect to the covariant functor $\mathbb{C}/-:\mathbb{C}\to\mathsf{Cat}$. In detail, for $\mathbb{A}\in\mathsf{Cat}$ and $c\in\mathbb{C}$ define $\nu_{\mathbb{C}}(\mathbb{A})(c)$ to be the Hom-set,

$$\nu_{\mathbb{C}}(\mathbb{A})(c) = \mathsf{Cat}(\mathbb{C}/_c, \mathbb{A}),$$

with contravariant action on $h:d\to c$ given by precomposing a functor $P:\mathbb{C}/_c\to\mathbb{A}$ with the postcomposition functor

$$\mathbb{C}/_h:\mathbb{C}/_d\longrightarrow\mathbb{C}/_c$$
.

For the adjunction, observe that the slice category \mathbb{C}/c is the category of elements of the representable functor yc,

$$\int_{\mathbb{C}} \mathrm{y} c \ \cong \ \mathbb{C}/_c \,.$$

Thus for all representables yc, we have the required natural isomorphism

$$\widehat{\mathbb{C}}\big(\mathsf{y} c\,,\,\nu_{\mathbb{C}}(\mathbb{A})\big) \;\cong\; \nu_{\mathbb{C}}(\mathbb{A})(c) \;=\; \mathsf{Cat}\big(\mathbb{C}/_c\,,\,\mathbb{A}\big) \;\cong\; \mathsf{Cat}\big(\int_{\mathbb{C}}\mathsf{y} c\,,\,\mathbb{A}\big)\,.$$

For arbitrary presheaves X, one uses the presentation of X as a colimit of representables over the index category $\int_{\mathbb{C}} X$, and the easy to prove fact

that $\int_{\mathbb{C}}$ itself preserves colimits. Indeed, for any category \mathbb{D} , we have an isomorphism in Cat,

$$\varinjlim_{d\in\mathbb{D}} \mathbb{D}/_d \ \cong \ \mathbb{D} \,.$$

When \mathbb{C} is fixed, as here, we may omit the subscript from the notation $\int_{\mathbb{C}}$ and $y_{\mathbb{C}}$ and $\nu_{\mathbb{C}}$. The unit and counit maps of the adjunction $\int \dashv \nu$, vis.

$$\eta: X \longrightarrow \nu \int X,$$
 $\epsilon: \int \nu \mathbb{A} \longrightarrow \mathbb{A},$

are as follows. At $c \in \mathbb{C}$, for $x : \mathsf{y}c \to X$, the functor $(\eta_X)_c(x) : \mathbb{C}/_c \to \mathbb{C}/_X$ is just composition with x,

$$(\eta_X)_c(x) = \mathbb{C}/_x : \mathbb{C}/_c \longrightarrow \mathbb{C}/_X. \tag{5}$$

For $\mathbb{A} \in \mathsf{Cat}$, the functor $\epsilon : \int \nu \mathbb{A} \to \mathbb{A}$ takes a pair $(c \in \mathbb{C}, f : \mathbb{C}/_c \to \mathbb{A})$ to the object $f(1_c) \in \mathbb{A}$,

$$\epsilon(c, f) = f(1_c).$$

Lemma 2. For any $f: Y \to X$, the naturality square below is a pullback.

$$\begin{array}{ccc}
Y & \xrightarrow{\eta_Y} & \nu \int Y \\
f \downarrow & & \downarrow \nu \int f \\
X & \xrightarrow{\eta_X} & \nu \int X.
\end{array} (6)$$

Proof. It suffices to prove it for the case $f:X\to 1$. Thus consider the square

$$\begin{array}{ccc}
X & \xrightarrow{\eta_X} & \nu \int X \\
\downarrow & & \downarrow \\
1 & \xrightarrow{\eta_1} & \nu \int 1.
\end{array}$$
(7)

Evaluating at $c \in \mathbb{C}$ and applying (5) then gives the following square in Set.

$$Xc \xrightarrow{\mathbb{C}/-} \mathsf{Cat}(\mathbb{C}/_c, \mathbb{C}/_X)$$

$$\downarrow \qquad \qquad \downarrow$$

$$1c \xrightarrow{\mathbb{C}/-} \mathsf{Cat}(\mathbb{C}/_c, \mathbb{C}/_1)$$
(8)

The image of $* \in 1c$ along the bottom is the forgetful functor $U_c : \mathbb{C}/c \to \mathbb{C}$, and its fiber under the map on the right is therefore the set of functors $F : \mathbb{C}/c \to \mathbb{C}/X$ such that $U_X \circ F = U_c$, where $U_X : \mathbb{C}/X \to \mathbb{C}$ is also a forgetful functor. But any such F is easily seen to be uniquely of the form \mathbb{C}/X for $X = F(1_c) : yc \to X$.

3. Classifying families

For the terminal presheaf $1 \in \widehat{\mathbb{C}}$, we have $\int 1 \cong \mathbb{C}$, so for every $X \in \widehat{\mathbb{C}}$ there is a canonical projection $\int X \to \mathbb{C}$, which is easily seen to be a discrete fibration. It follows that for any map $Y \to X$ of presheaves, the associated map $\int Y \to \int X$ is also a discrete fibration. Ignoring size issues for the moment, recall that discrete fibrations in Cat are classified by the forgetful functor $\operatorname{Set}^{\operatorname{op}} \to \operatorname{Set}^{\operatorname{op}}$ from (the opposites of) the category of pointed sets to that of sets. For every presheaf $X \in \widehat{\mathbb{C}}$, we therefore have a pullback diagram in Cat,

$$\int X \longrightarrow \dot{\operatorname{Set}}^{\operatorname{op}} \\
\downarrow \qquad \qquad \downarrow \\
\mathbb{C} \xrightarrow{X} \operatorname{Set}^{\operatorname{op}}.$$
(9)

Transposing by the adjunction $\int \exists \nu$ then gives a commutative square in $\widehat{\mathbb{C}}$,

$$\begin{array}{ccc}
X & \longrightarrow \nu \dot{\mathsf{Set}}^{\mathrm{op}} \\
\downarrow & & \downarrow \\
1 & \xrightarrow{\tilde{X}} \nu \dot{\mathsf{Set}}^{\mathrm{op}}.
\end{array} \tag{10}$$

Lemma 3. The square (10) is a pullback in $\widehat{\mathbb{C}}$. More generally, for any map $Y \to X$ in $\widehat{\mathbb{C}}$, there is a pullback square

$$Y \longrightarrow \nu \dot{\mathsf{Set}}^{\mathrm{op}}$$

$$\downarrow \qquad \qquad \downarrow$$

$$X \longrightarrow \nu \mathsf{Set}^{\mathrm{op}}.$$
(11)

Proof. Apply the right adjoint ν to the pullback square (9) and paste the naturality square (6) from Lemma 2 on the left, to obtain the transposed square (11) as a pasting of two pullbacks.

Let us write $\dot{\mathcal{V}} \to \mathcal{V}$ for the vertical map on the right in (11), so that

$$\dot{\mathcal{V}} = \nu \dot{\mathsf{Set}}^{\mathrm{op}}$$
 (12) $\mathcal{V} = \nu \mathsf{Set}^{\mathrm{op}}$.

We can summarize our results so far as follows.

Proposition 4. The nerve $\dot{\mathcal{V}} \to \mathcal{V}$ of the classifier for discrete fibrations $\dot{\mathsf{Set}}^{\mathrm{op}} \to \mathsf{Set}^{\mathrm{op}}$, as defined in (12), classifies natural transformations $Y \to X$ in $\widehat{\mathbb{C}}$, in the sense that there is always a pullback square,

$$\begin{array}{ccc}
Y & \longrightarrow & \dot{\mathcal{V}} \\
\downarrow & \downarrow & \downarrow \\
X & \xrightarrow{\tilde{\mathcal{V}}} & \mathcal{V}.
\end{array} \tag{13}$$

The classifying map $\tilde{Y}: X \to \mathcal{V}$ is determined by the adjunction $\int \exists \nu$ as the transpose of the classifying map of the discrete fibration $\int X \to \int Y$.

Of course, $\dot{\mathcal{V}} \to \mathcal{V}$ itself cannot be a map in $\widehat{\mathbb{C}}$, for reasons of size.

4. Small maps

Let α be a cardinal number and call the sets that are strictly smaller α small. Let $\mathsf{Set}_{\alpha} \hookrightarrow \mathsf{Set}$ be the full subcategory of α -small sets. Call a
presheaf $X: \mathbb{C}^{\mathrm{op}} \to \mathsf{Set}$ α -small if all of its values are α -small sets, and thus
if, and only if, it factors through $\mathsf{Set}_{\alpha} \hookrightarrow \mathsf{Set}$. Call a map $f: Y \to X$ of
presheaves α -small if all of the fibers $f_c^{-1}\{x\} \subseteq Yc$ are α -small sets (for all $c \in \mathbb{C}$ and $x \in Xc$). The latter condition is of course equivalent to saying
that, in the pullback square over the element $x: \mathsf{yc} \to X$,

$$Y_{x} \longrightarrow Y$$

$$\downarrow \qquad \qquad \downarrow f$$

$$yc \xrightarrow{x} X,$$

$$(14)$$

the presheaf Y_x is α -small.

Now let us restrict the specification (12) of $\dot{\mathcal{V}} \to \mathcal{V}$ to the α -small sets:

$$\dot{\mathcal{V}}_{\alpha} = \nu \mathsf{Set}^{\mathsf{op}}_{\alpha}$$
 (15) $\mathcal{V}_{\alpha} = \nu \mathsf{Set}^{\mathsf{op}}_{\alpha}$.

Then the evident forgetful map $\dot{\mathcal{V}}_{\alpha} \to \mathcal{V}_{\alpha}$ is a map in the category $\widehat{\mathbb{C}}$ of presheaves, and it is in fact α -small. Moreover, it has the following basic property, which is just a restriction of the basic property of $\dot{\mathcal{V}} \to \mathcal{V}$ stated in Proposition 4.

Proposition 5. The map $\dot{\mathcal{V}}_{\alpha} \to \mathcal{V}_{\alpha}$ classifies α -small maps $f: Y \to X$ in $\widehat{\mathbb{C}}$, in the sense that there is always a pullback square,

$$\begin{array}{ccc}
Y & \longrightarrow \dot{\mathcal{V}}_{\alpha} \\
\downarrow & \downarrow \\
X & \longrightarrow & \mathcal{V}_{\alpha}.
\end{array} \tag{16}$$

The classifying map $\tilde{Y}: X \to \mathcal{V}_{\alpha}$ is determined by the adjunction $\int \dashv \nu$ as (the factorization of) the transpose of the classifying map of the discrete fibration $\int X \to \int Y$.

Proof. If $Y \to X$ is small, its classifying map $\tilde{Y}: X \to \mathcal{V}$ factors through $\mathcal{V}_{\alpha} \hookrightarrow \mathcal{V}$, as indicated below,

$$Y \xrightarrow{\nu \operatorname{Set}_{\alpha}^{\operatorname{op}}} \hookrightarrow \nu \operatorname{Set}^{\operatorname{op}}$$

$$\downarrow \qquad \qquad \downarrow \qquad$$

in virtue of the following adjoint transposition,

$$\int Y \longrightarrow \overrightarrow{\operatorname{Set}_{\alpha}}^{\operatorname{op}} \longrightarrow \overrightarrow{\operatorname{Set}^{\operatorname{op}}} \\
\downarrow \qquad \qquad \downarrow \qquad \qquad \downarrow \\
\int X \longrightarrow \operatorname{Set}_{\alpha}^{\operatorname{op}} \longrightarrow \operatorname{Set}^{\operatorname{op}}.$$
(18)

Note that the square on the right is evidently a pullback, and the one on the left therefore is, too, because the outer rectangle is the classifying pulback of the discrete fibration $\int Y \to \int X$, as stated. Thus the left square in (17) is a pullback.

5. Examples

1. Let $\alpha = \kappa$ a strongly inaccessible cadinal, so that $\mathsf{ob}(\mathsf{Set}_{\kappa})$ is a Grothendieck universe. Then the Hofmann-Streicher universe of (1) is recovered in the present setting as the κ -small map classifier

$$\mathsf{E} l \cong \dot{\mathcal{V}}_{\kappa} \longrightarrow \mathcal{V}_{\kappa} \cong U$$

in the sense of Proposition 5. Indeed, for $c \in \mathbb{C}$, we have

$$\mathcal{V}_{\kappa}c = \nu(\operatorname{Set}_{\kappa}^{\operatorname{op}})(c) = \operatorname{Cat}(\mathbb{C}/_{c}, \operatorname{Set}_{\kappa}^{\operatorname{op}}) = \operatorname{ob}(\widehat{\mathbb{C}/_{c}}) = Uc$$

$$\dot{\mathcal{V}}_{\kappa}c = \nu(\operatorname{Set}_{\kappa}^{\operatorname{op}})(c) = \operatorname{Cat}(\mathbb{C}/_{c}, \operatorname{Set}_{\kappa}^{\operatorname{op}}) = \int_{\mathbb{C}/_{c}} \operatorname{E}l(\langle c, A \rangle). \tag{19}$$

2. By functoriality of $\nu: \mathsf{Cat} \to \widehat{\mathbb{C}}$, a sequence of Grothendieck universes

$$\mathcal{U}\subseteq\mathcal{U}'\subseteq...$$

in Set gives rise to a (cumulative) sequence of type-theoretic universes

$$\mathcal{V} \rightarrowtail \mathcal{V}' \rightarrowtail ...$$

in $\widehat{\mathbb{C}}$. More precisely, there is a sequence of cartesian squares,

in the image of $\nu: \mathsf{Cat} \longrightarrow \widehat{\mathbb{C}}$, classifying small maps in $\widehat{\mathbb{C}}$ of increasing size, in the sense of Proposition 5.

3. Let $\alpha = 2$ so that $1 \to 2$ is the subobject classifier of Set, and

$$\mathbb{1}=\stackrel{\cdot}{\operatorname{Set}_2^{\operatorname{op}}}\longrightarrow\operatorname{Set}_2^{\operatorname{op}}=\mathbb{2}$$

is then a classifier in Cat for full subcategories $\mathbb{S} \hookrightarrow \mathbb{A}$ that are closed under the domains of arrows $a \to s$ for $s \in \mathbb{S}$ ("total sieves"). The "lifted universe" $\dot{\mathcal{V}}_2 \to \mathcal{V}_2$ is then the subobject classifier $1 \to \Omega$ of $\widehat{\mathbb{C}}$,

$$1 = \nu \mathbb{1} = \dot{\mathcal{V}}_2 \longrightarrow \mathcal{V}_2 = \nu \mathbb{2} = \Omega.$$

4. Let $i: 2 \hookrightarrow \mathsf{Set}_{\kappa}$ and $p: \mathsf{Set}_{\kappa} \to 2$ be the embedding-retraction pair with $i: 2 \hookrightarrow \mathsf{Set}_{\kappa}$ the inclusion of the full subcategory on the sets $\{0,1\}$ and $p: \mathsf{Set}_{\kappa} \to 2$ the retraction that takes $0 = \emptyset$ to itself, and everything else (i.e. the non-empty sets) to $1 = \{\emptyset\}$. There is a retraction (of arrows) in Cat ,

$$\begin{array}{cccc}
\mathbb{1} & & & \dot{\operatorname{Set}}_{\kappa} & \longrightarrow & \mathbb{1} \\
\downarrow & & & \downarrow & & \downarrow \\
\mathbb{2} & & & \dot{\operatorname{Set}}_{\kappa} & \xrightarrow{p} & \mathbb{2}
\end{array} \tag{21}$$

where the left square is a pullback.

By the functoriality of $\nu : \mathsf{Cat} \to \widehat{\mathbb{C}}$ we then have a retract diagram in $\widehat{\mathbb{C}}$, again with a pullback on the left,

$$\begin{array}{cccc}
1 & \longrightarrow \dot{\mathcal{V}}_{\kappa} & \longrightarrow 1 \\
\downarrow & & \downarrow & \downarrow \\
\Omega & & \longleftarrow & \Omega
\end{array}$$

$$(22)$$

where for any $\phi: X \to \Omega$ the subobject $\{\phi\} \mapsto X$ is classified as a small map by the composite $\{\phi\}: X \to \mathcal{V}_{\kappa}$, and for any small map $A \to X$, the image $[A] \mapsto X$ is classified as a subobject by the composite $[\alpha]: X \to \mathcal{V}_{\kappa} \to \Omega$, where $\alpha: X \to \mathcal{V}_{\kappa}$ classifies $A \to X$. The idempotent composite

$$\|-\|=[\{-\}]:\mathcal{V}_{\kappa}\longrightarrow\mathcal{V}_{\kappa}$$

is the propositional truncation modality in the natural model of type theory given by $\dot{\mathcal{V}}_{\kappa} \to \mathcal{V}_{\kappa}$ (see [AGH21]).
