A remark on Hofmann-Streicher universes

Steve Awodey

May 20, 2022

Abstract

We have another look at the construction by Hofmann and Streicher of a semantic universe $\mathsf{E}l \to U$ for the interpretation of Martin-Löf type theory in a presheaf category $[\mathbb{C}^{\mathrm{op}}, \mathsf{Set}]$. It turns out that $\mathsf{E}l \to U$ can be described as the *categorical nerve* of the classifier $\dot{\mathsf{Set}}^{\mathrm{op}} \to \mathsf{Set}^{\mathrm{op}}$ for discrete fibrations in Cat, where the nerve is right adjoint to the well-known "Grothendieck construction" taking a presheaf $P : \mathbb{C}^{\mathrm{op}} \to \mathsf{Set}$ to its category of elements $\int_{\mathbb{C}} P$.

Let $\widehat{\mathbb{C}} = [\mathbb{C}^{\mathrm{op}}, \mathsf{Set}]$ be the category of presheaves on a small category $\mathbb{C}$.

1. The Hofmann-Streicher universe

In [HS97] the authors define a (type-theoretic) *universe*

$$E \longrightarrow U \tag{1}$$

in $\widehat{\mathbb{C}}$ as follows. For $I \in \mathbb{C}$, set

$$U(I) = \mathsf{ob}(\widehat{\mathbb{C}/_I}) \tag{2}$$

$$E(I) = \coprod_{A \in U(I)} \mathsf{E}l(\langle I, A \rangle) \tag{3}$$

$$\mathsf{E}l(\langle I, A \rangle) = A(id_I) \tag{4}$$

with an evident associated action on morphisms, which need not concern us for the moment. A few comments are required:

1. In (2), we have taken the underlying set of objects of the category $\widehat{\mathbb{C}/_I} = [\mathbb{C}/_I{}^{\mathrm{op}}, \mathsf{Set}]$.

2. In (4), and throughout, the authors steadfastly adopt the "categories with families" point of view in describing the morphism $E \to U$ in $\widehat{\mathbb{C}}$ as an object in

$$\widehat{\int_{\mathbb{C}} U} \simeq \widehat{\mathbb{C}}/_U \,, \tag{5}$$

and thus as a presheaf on the *category of elements* $\int_{\mathbb{C}} U$, rather than specifying the object E in $\widehat{\mathbb{C}}$. Thus the argument $\langle I, A \rangle \in \int_{\mathbb{C}} U$ in (4) consists of an object $I \in \mathbb{C}$ and an element $A \in U(I)$.

3. In order to account for size issues, the authors assume a Grothendieck universe $\mathcal{U}$ in Set, the elements of which are called *small*. The category $\mathbb{C}$ is then assumed to be small, as are the values of the presheaves (unless otherwise stated).

The presheaf U, which is not small, is regarded as the Grothendieck universe $\mathcal{U}$ "lifted" from Set to $[\mathbb{C}^{\mathrm{op}}, \mathsf{Set}]$. We will analyse the construction of (1) from a slightly different perspective in order to arrive at its basic property as a classifier for small families in $\widehat{\mathbb{C}}$.

2. An unused adjunction

For a presheaf X on $\mathbb{C}$, recall that the category of elements is the comma category,

$$\int_{\mathbb{C}} X \;=\; \mathsf{y}_{\mathbb{C}}/X \,,$$
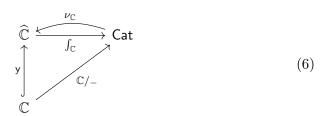

where $\mathsf{y}_{\mathbb{C}} : \mathbb{C} \to [\mathbb{C}^{\mathrm{op}}, \mathsf{Set}]$ is the Yoneda embedding, which we may supress and write simply $\mathbb{C}/X$. While the category of elements $\int_{\mathbb{C}} X$ is used in the specification of the Hofmann-Streicher universe $\mathsf{El} \to U$ at the point (5), the authors seem to have missed a trick which would have simplified things:

Proposition 1 ([Gro83],§28)**.** *The category of elements functor $\int_{\mathbb{C}} : \widehat{\mathbb{C}} \longrightarrow$* Cat *has a right adjoint, which we denote*

$$\nu_{\mathbb{C}} : \mathsf{Cat} \longrightarrow \widehat{\mathbb{C}} \,.$$

For a small category $\mathbb{A}$, we call the presheaf $\nu_{\mathbb{C}}(\mathbb{A})$ the $\mathbb{C}$-nerve of $\mathbb{A}$.

Proof. As suggested by the name, the adjunction $\int_{\mathbb{C}} \dashv \nu_{\mathbb{C}}$ can be seen as the familiar "realization $\dashv$ nerve" construction with respect to the covariant functor $\mathbb{C}/- : \mathbb{C} \to \mathsf{Cat}$, as indicated below.

$$\text{(6)}$$

In detail, for $\mathbb{A} \in \mathsf{Cat}$ and $c \in \mathbb{C}$, let $\nu_{\mathbb{C}}(\mathbb{A})(c)$ be the Hom-set of functors,

$$\nu_{\mathbb{C}}(\mathbb{A})(c) = \mathsf{Cat}\big(\mathbb{C}/_c\,,\,\mathbb{A}\big)\,,$$

with contravariant action on $h : d \to c$ given by precomposing a functor $P : \mathbb{C}/_c \to \mathbb{A}$ with the postcomposition functor

$$\mathbb{C}/_h : \mathbb{C}/_d \longrightarrow \mathbb{C}/_c\,.$$

For the adjunction, observe that the slice category $\mathbb{C}/_c$ is the category of elements of the representable functor $\mathsf{y}c$,

$$\int_{\mathbb{C}} \mathsf{y}c \;\cong\; \mathbb{C}/_c\,.$$

Thus for representables $\mathsf{y}c$, we have the required natural isomorphism

$$\widehat{\mathbb{C}}\big(\mathsf{y}c,\,\nu_{\mathbb{C}}(\mathbb{A})\big) \;\cong\; \nu_{\mathbb{C}}(\mathbb{A})(c) \;=\; \mathsf{Cat}\big(\mathbb{C}/_c,\,\mathbb{A}\big) \;\cong\; \mathsf{Cat}\big(\textstyle\int_{\mathbb{C}} \mathsf{y}c,\,\mathbb{A}\big)\,.$$

For arbitrary presheaves X, one uses the presentation of X as a colimit of representables over the index category $\int_{\mathbb{C}} X$, and the easy to prove fact that $\int_{\mathbb{C}}$ itself preserves colimits. Indeed, for any category $\mathbb{D}$, we have an isomorphism in Cat,

$$\varinjlim_{d \in \mathbb{D}} \mathbb{D}/_d \;\cong\; \mathbb{D}\,.$$

$\square$

When $\mathbb{C}$ is fixed, as here, we may omit the subscript from the notation $\mathsf{y}_{\mathbb{C}}$ and $\int_{\mathbb{C}}$ and $\nu_{\mathbb{C}}$. The unit and counit maps of the adjunction $\int \dashv \nu$, vis.

$$\eta : X \longrightarrow \nu \textstyle\int X\,,$$
$$\epsilon : \textstyle\int \nu \mathbb{A} \longrightarrow \mathbb{A}\,,$$

are as follows. At $c \in \mathbb{C}$, for $x : \mathsf{y}c \to X$, the functor $(\eta_X)_c(x) : \mathbb{C}/_c \to \mathbb{C}/_X$ is just composition with x,

$$(\eta_X)_c(x) = \mathbb{C}/_x : \mathbb{C}/_c \longrightarrow \mathbb{C}/_X\,. \tag{7}$$

For $\mathbb{A} \in \mathsf{Cat}$, the functor $\epsilon : \int \nu \mathbb{A} \to \mathbb{A}$ takes a pair $(c \in \mathbb{C}, f : \mathbb{C}/_c \to \mathbb{A})$ to the object $f(1_c) \in \mathbb{A}$,

$$\epsilon(c, f) = f(1_c).$$

Lemma 2. *For any $f : Y \to X$, the naturality square below is a pullback.*

$$\begin{array}{ccc} Y & \xrightarrow{\eta_Y} & \nu\!\int Y \\ {\scriptstyle f}\downarrow & & \downarrow{\scriptstyle \nu\!\int f} \\ X & \xrightarrow[\eta_X]{} & \nu\!\int X. \end{array} \qquad (8)$$

Proof. It suffices to prove it for the case $f : X \to 1$. Thus consider the square

$$\begin{array}{ccc} X & \xrightarrow{\eta_X} & \nu\!\int X \\ \downarrow & & \downarrow \\ 1 & \xrightarrow[\eta_1]{} & \nu\!\int 1. \end{array} \qquad (9)$$

Evaluating at $c \in \mathbb{C}$ and applying (7) then gives the following square in Set.

$$\begin{array}{ccc} Xc & \xrightarrow{\mathbb{C}/_-} & \mathsf{Cat}\big(\mathbb{C}/_c,\, \mathbb{C}/_X\big) \\ \downarrow & & \downarrow \\ 1c & \xrightarrow[\mathbb{C}/_-]{} & \mathsf{Cat}\big(\mathbb{C}/_c,\, \mathbb{C}/_1\big) \end{array} \qquad (10)$$

The image of $* \in 1c$ along the bottom is the forgetful functor $U_c : \mathbb{C}/_c \to \mathbb{C}$, and its fiber under the map on the right is therefore the set of functors $F : \mathbb{C}/_c \to \mathbb{C}/_X$ such that $U_X \circ F = U_c$, where $U_X : \mathbb{C}/_X \to \mathbb{C}$ is also a forgetful functor. But any such F is easily seen to be uniquely of the form $\mathbb{C}/_x$ for $x = F(1_c) : \mathsf{y}c \to X$. $\qquad\square$

3. Classifying families

For the terminal presheaf $1 \in \widehat{\mathbb{C}}$, we have $\int 1 \cong \mathbb{C}$, so for every $X \in \widehat{\mathbb{C}}$ there is a canonical projection $\int X \to \mathbb{C}$, which is easily seen to be a discrete fibration. It follows that for any map $Y \to X$ of presheaves, the associated map $\int Y \to \int X$ is also a discrete fibration. Ignoring size issues for the moment, recall that discrete fibrations in Cat are classified by the forgetful functor $\dot{\mathsf{Set}}^{\mathrm{op}} \to \mathsf{Set}^{\mathrm{op}}$ from (the opposites of) the category of pointed sets to that of sets. For every presheaf $X \in \widehat{\mathbb{C}}$, we therefore have a pullback diagram in Cat,

$$\begin{array}{ccc} \int X & \longrightarrow & \dot{\mathsf{Set}}^{\mathrm{op}} \\ \downarrow & \lrcorner & \downarrow \\ \mathbb{C} & \xrightarrow[X]{} & \mathsf{Set}^{\mathrm{op}}. \end{array} \qquad (11)$$

Transposing by the adjunction $\int \dashv \nu$ then gives a commutative square in $\widehat{\mathbb{C}}$,

$$\begin{array}{ccc} X & \longrightarrow & \nu\dot{\mathsf{Set}}^{\mathrm{op}} \\ \downarrow & & \downarrow \\ 1 & \xrightarrow[\tilde{X}]{} & \nu\mathsf{Set}^{\mathrm{op}}. \end{array} \tag{12}$$

Lemma 3. *The square* (12) *is a pullback in* $\widehat{\mathbb{C}}$. *More generally, for any map* $Y \to X$ *in* $\widehat{\mathbb{C}}$, *there is a pullback square*

$$\begin{array}{ccc} Y & \longrightarrow & \nu\dot{\mathsf{Set}}^{\mathrm{op}} \\ \downarrow & \lrcorner & \downarrow \\ X & \longrightarrow & \nu\mathsf{Set}^{\mathrm{op}}. \end{array} \tag{13}$$

Proof. Apply the right adjoint ν to the pullback square (11) and paste the naturality square (8) from Lemma 2 on the left, to obtain the transposed square (13) as a pasting of two pullbacks. $\qquad\square$

Let us write $\dot{\mathcal{V}} \to \mathcal{V}$ for the vertical map on the right in (13), so that

$$\begin{aligned} \dot{\mathcal{V}} &= \nu\dot{\mathsf{Set}}^{\mathrm{op}} \\ \mathcal{V} &= \nu\mathsf{Set}^{\mathrm{op}}. \end{aligned} \tag{14}$$

We can summarize our results so far as follows.

Proposition 4. *The nerve* $\dot{\mathcal{V}} \to \mathcal{V}$ *of the classifier for discrete fibrations* $\dot{\mathsf{Set}}^{\mathrm{op}} \to \mathsf{Set}^{\mathrm{op}}$, *as defined in* (14), *classifies natural transformations* $Y \to X$ *in* $\widehat{\mathbb{C}}$, *in the sense that there is always a pullback square,*

$$\begin{array}{ccc} Y & \longrightarrow & \dot{\mathcal{V}} \\ \downarrow & \lrcorner & \downarrow \\ X & \xrightarrow[\tilde{Y}]{} & \mathcal{V}. \end{array} \tag{15}$$

The classifying map $\tilde{Y} : X \to \mathcal{V}$ *is determined by the adjunction* $\int \dashv \nu$ *as the transpose of the classifiyng map of the discrete fibration* $\int X \to \int Y$.

Of course, $\dot{\mathcal{V}} \to \mathcal{V}$ itself cannot be a map in $\widehat{\mathbb{C}}$, for reasons of size.

4. Small maps

Let α be a cardinal number and call the sets that are strictly smaller α-*small*. Let $\mathsf{Set}_\alpha \hookrightarrow \mathsf{Set}$ be the full subcategory of α-small sets. Call a presheaf $X : \mathbb{C}^{\mathrm{op}} \to \mathsf{Set}$ α-small if all of its values are α-small sets, and thus if, and only if, it factors through $\mathsf{Set}_\alpha \hookrightarrow \mathsf{Set}$. Call a map $f : Y \to X$ of presheaves α-small if all of the fibers $f_c^{-1}\{x\} \subseteq Yc$ are α-small sets (for all $c \in \mathbb{C}$ and $x \in Xc$). The latter condition is of course equivalent to saying that, in the pullback square over the element $x : \mathsf{y}c \to X$,

$$
\begin{array}{ccc}
Y_x & \longrightarrow & Y \\
\downarrow & {\scriptstyle \lrcorner} & \downarrow{\scriptstyle f} \\
\mathsf{y}c & \xrightarrow[\ x\ ]{} & X,
\end{array}
\tag{16}
$$

the presheaf Y_x is α-small.

Now let us restrict the specification (14) of $\dot{\mathcal{V}} \to \mathcal{V}$ to the α-small sets:

$$
\begin{aligned}
\dot{\mathcal{V}}_\alpha &= \nu \dot{\mathsf{Set}}_\alpha^{\mathrm{op}} \\
\mathcal{V}_\alpha &= \nu \mathsf{Set}_\alpha^{\mathrm{op}}.
\end{aligned}
\tag{17}
$$

Then the evident forgetful map $\dot{\mathcal{V}}_\alpha \to \mathcal{V}_\alpha$ *is* a map in the category $\widehat{\mathbb{C}}$ of presheaves, and it is in fact α-small. Moreover, it has the following basic property, which is just a restriction of the basic property of $\dot{\mathcal{V}} \to \mathcal{V}$ stated in Proposition 4.

Proposition 5. *The map $\dot{\mathcal{V}}_\alpha \to \mathcal{V}_\alpha$ classifies α-small maps $f : Y \to X$ in $\widehat{\mathbb{C}}$, in the sense that there is always a pullback square,*

$$
\begin{array}{ccc}
Y & \longrightarrow & \dot{\mathcal{V}}_\alpha \\
\downarrow & {\scriptstyle \lrcorner} & \downarrow \\
X & \xrightarrow[\ \tilde{Y}\ ]{} & \mathcal{V}_\alpha.
\end{array}
\tag{18}
$$

The classifying map $\tilde{Y} : X \to \mathcal{V}_\alpha$ is determined by the adjunction $\int \dashv \nu$ as (the factorization of) the transpose of the classifiyng map of the discrete fibration $\int X \to \int Y$.

Proof. If $Y \to X$ is α-small, its classifying map $\tilde{Y} : X \to \mathcal{V}$ factors through

6

$\mathcal{V}_\alpha \hookrightarrow \mathcal{V}$, as indicated below,

$$
\begin{array}{ccc}
Y \longrightarrow \nu\dot{\mathsf{Set}}_\alpha{}^{\mathrm{op}} \longhookrightarrow \nu\dot{\mathsf{Set}}{}^{\mathrm{op}} \\
\downarrow \qquad\qquad \downarrow \qquad\qquad \downarrow \\
X \longrightarrow \nu\mathsf{Set}_\alpha{}^{\mathrm{op}} \longhookrightarrow \nu\mathsf{Set}{}^{\mathrm{op}},
\end{array}
\tag{19}
$$

in virtue of the following adjoint transposition,

$$
\begin{array}{ccc}
\int Y \longrightarrow \dot{\mathsf{Set}}_\alpha{}^{\mathrm{op}} \longhookrightarrow \dot{\mathsf{Set}}{}^{\mathrm{op}} \\
\downarrow \qquad\qquad \downarrow \qquad\qquad \downarrow \\
\int X \longrightarrow \mathsf{Set}_\alpha{}^{\mathrm{op}} \longhookrightarrow \mathsf{Set}{}^{\mathrm{op}}.
\end{array}
\tag{20}
$$

Note that the square on the right is evidently a pullback, and the one on the left therefore is, too, because the outer rectangle is the classifying pullback of the discrete fibration $\int Y \to \int X$, as stated. Thus the left square in (19) is a pullback. $\qquad\square$

5. Examples

1. Let $\alpha = \kappa$ a strongly inaccessible cadinal, so that $\mathsf{ob}(\mathsf{Set}_\kappa)$ is a Grothendieck universe. Then the Hofmann-Streicher universe of (1) is recovered in the present setting as the κ-small map classifier

$$
E \cong \dot{\mathcal{V}}_\kappa \longrightarrow \mathcal{V}_\kappa \cong U
$$

in the sense of Proposition 5. Indeed, for $c \in \mathbb{C}$, we have

$$
\mathcal{V}_\kappa c \;=\; \nu(\mathsf{Set}_\kappa^{\mathsf{op}})(c) = \mathsf{Cat}\big(\mathbb{C}/_c,\, \mathsf{Set}_\kappa^{\mathsf{op}}\big) \;=\; \mathsf{ob}(\widehat{\mathbb{C}/_c}) \;=\; Uc. \tag{21}
$$

For $\dot{\mathcal{V}}_\kappa$ we then have,

$$
\begin{aligned}
\dot{\mathcal{V}}_\kappa c \;=\; \nu(\dot{\mathsf{Set}}_\kappa^{\mathsf{op}})(c) \;&=\; \mathsf{Cat}\big(\mathbb{C}/_c,\, \dot{\mathsf{Set}}_\kappa^{\mathsf{op}}\big) \\
&\cong\; \coprod\nolimits_{A \in \mathcal{V}_\kappa c} \mathsf{Cat}_{\mathbb{C}/_c}\big(\mathbb{C}/_c,\, A^*\mathsf{Set}_\kappa^{\mathsf{op}}\big)
\end{aligned}
\tag{22}
$$

where the A-summand in (22) is defined by taking sections of the pullback indicated below.

$$
\begin{array}{ccc}
A^*\mathsf{Set}_\kappa^{\mathsf{op}} & \longrightarrow & \dot{\mathsf{Set}}_\kappa^{\mathsf{op}} \\
\downarrow & \nearrow & \downarrow \\
\mathbb{C}/c & \xrightarrow{\quad A \quad} & \mathsf{Set}_\kappa^{\mathsf{op}}
\end{array}
\tag{23}
$$

But $A^*\mathsf{Set}_\kappa^{\mathsf{op}} \cong \int_{\mathbb{C}/c} A$ over $\mathbb{C}/c$, and sections of this discrete fibration in Cat correspond uniquely to natural maps $1 \to A$ in $\widehat{\mathbb{C}/c}$. Since 1 is representable in $\widehat{\mathbb{C}/c}$ we can continue (22) by

$$
\begin{aligned}
\dot{\mathcal{V}}_\kappa c & \cong \coprod_{A \in \mathcal{V}_\kappa c} \mathsf{Cat}_{\mathbb{C}/c}\big(\mathbb{C}/c,\, A^*\mathsf{Set}_\kappa^{\mathsf{op}}\big) \\
& \cong \coprod_{A \in \mathcal{V}_\kappa c} \widehat{\mathbb{C}/c}(1, A) \\
& \cong \coprod_{A \in \mathcal{V}_\kappa c} A(1_c) \\
& = \coprod_{A \in \mathcal{V}_\kappa c} \mathsf{El}(\langle c, A \rangle) \\
& = Ec.
\end{aligned}
$$

2. By functoriality of $\nu : \mathsf{Cat} \to \widehat{\mathbb{C}}$, a sequence of Grothendieck universes

$$
\mathcal{U} \subseteq \mathcal{U}' \subseteq \dots
$$

in Set gives rise to a (cumulative) sequence of type-theoretic universes

$$
\mathcal{V} \rightarrowtail \mathcal{V}' \rightarrowtail \dots
$$

in $\widehat{\mathbb{C}}$. More precisely, there is a sequence of cartesian squares,

$$
\begin{array}{ccccc}
\dot{\mathcal{V}} & \rightarrowtail & \dot{\mathcal{V}}' & \rightarrowtail & \dots \\
\downarrow & & \downarrow & & \\
\mathcal{V} & \rightarrowtail & \mathcal{V}' & \rightarrowtail & \dots,
\end{array}
\tag{24}
$$

in the image of $\nu : \mathsf{Cat} \longrightarrow \widehat{\mathbb{C}}$, classifying small maps in $\widehat{\mathbb{C}}$ of increasing size, in the sense of Proposition 5.

3. Let $\alpha = 2$ so that $1 \to 2$ is the subobject classifier of Set, and

$$
\mathbb{1} = \dot{\mathsf{Set}}_2^{\mathsf{op}} \longrightarrow \mathsf{Set}_2^{\mathsf{op}} = \mathbb{2}
$$

is then a classifier in Cat for full subcategories $\mathbb{S} \hookrightarrow \mathbb{A}$ that are closed under the domains of arrows $a \to s$ for $s \in \mathbb{S}$ ("total sieves"). The "lifted universe" $\dot{\mathcal{V}}_2 \to \mathcal{V}_2$ is then the subobject classifier $1 \to \Omega$ of $\widehat{\mathbb{C}}$,

$$1 = \nu\mathbb{1} = \dot{\mathcal{V}}_2 \longrightarrow \mathcal{V}_2 = \nu 2 = \Omega\,.$$

4. Let $i : 2 \hookrightarrow \mathsf{Set}_\kappa$ and $p : \mathsf{Set}_\kappa \to 2$ be the embedding-retraction pair with $i : 2 \hookrightarrow \mathsf{Set}_\kappa$ the inclusion of the full subcategory on the sets $\{0, 1\}$ and $p : \mathsf{Set}_\kappa \to 2$ the retraction that takes $0 = \emptyset$ to itself, and everything else (i.e. the non-empty sets) to $1 = \{\emptyset\}$. There is a retraction (of arrows) in Cat,

$$
\begin{array}{ccccc}
\mathbb{1} & \lhook\joinrel\longrightarrow & \dot{\mathsf{Set}}_\kappa & \longrightarrow & \mathbb{1} \\
\downarrow & \lrcorner & \downarrow & & \downarrow \\
2 & \underset{i}{\lhook\joinrel\longrightarrow} & \mathsf{Set}_\kappa & \underset{p}{\longrightarrow\!\!\!\!\to} & 2
\end{array}
\tag{25}
$$

where the left square is a pullback.

By the functoriality of $\nu : \mathsf{Cat} \to \widehat{\mathbb{C}}$ we then have a retract diagram in $\widehat{\mathbb{C}}$, again with a pullback on the left,

$$
\begin{array}{ccccc}
1 & \lhook\joinrel\longrightarrow & \dot{\mathcal{V}}_\kappa & \longrightarrow & 1 \\
\downarrow & \lrcorner & \downarrow & & \downarrow \\
\Omega & \underset{\{-\}}{\lhook\joinrel\longrightarrow} & \mathcal{V}_\kappa & \underset{[-]}{\longrightarrow\!\!\!\!\to} & \Omega
\end{array}
\tag{26}
$$

where for any $\phi : X \to \Omega$ the subobject $\{\phi\} \rightarrowtail X$ is classified as a small map by the composite $\{\phi\} : X \to \mathcal{V}_\kappa$, and for any small map $A \to X$, the image $[A] \rightarrowtail X$ is classified as a subobject by the composite $[\alpha] : X \to \mathcal{V}_\kappa \to \Omega$, where $\alpha : X \to \mathcal{V}_\kappa$ classifies $A \to X$. The idempotent composite

$$\|-\| = \{[-]\} : \mathcal{V}_\kappa \longrightarrow \mathcal{V}_\kappa$$

is the *propositional truncation modality* in the natural model of type theory given by $\dot{\mathcal{V}}_\kappa \to \mathcal{V}_\kappa$ (see [AGH21]).

[*factor through* $\mathsf{Cat}/\mathbb{C}$ *for right adjoint?*]
[$\mathbb{1} \to 2$ *classifies what in* Cat]
